

**TurboCAD is invaluable  
for producing  
good garden  
design for my  
discerning  
clients**

Peter Thomas has been using TurboCAD as his basic design tool ever since starting to work for a landscaping company as their garden designer. Already proficient in CAD and other design software it soon became his preferred method of working. Peter has been using the software now for almost six years.

**“**Although I did not have any specific problems which needed a software solution to help solve, it was imperative that I develop a work flow which was time-efficient and using CAD allows for very efficient editing and flexibility for producing drawings to different scales and formats.

*It took me 2 days to be using the software to a reasonable speed and proficiency. I have since taught it to other designers and one day of tutorials seems to be sufficient to get someone up and running.*

**“** My ‘Favourite Feature’ changes quite regularly. At the moment it would have to be the tabs at the bottom for generating multiple paperspace windows. Overall, the best thing about the program is its flexibility for customising.

*Designing is all about ‘what if’ scenarios and using TC makes that part of a project very easy to work through.*

*The main benefit to using the software is cost. I save money on the initial purchase, the production and storage of drawings, the amount of workspace I need and the time it takes to complete projects.*

*I use TC together with other imaging programs such as Photoshop, it integrates easily into my website and I am able to utilise printing services in the next town.*

*The export and import functionality of TC allows me to work and exchange information with other professionals across a broad range of software.*
